Discussion

**Note**

Discussed about recursive meeting implementation.
User can edit current meeting or all upcoming meetings.
Decided to provide radio button in create meeting page with Current and All option.

Implementation
Parent record creation - When we create new recursive meeting new two records will be created in meetings collection. One record will have recursive visible flag value as 'N' and another one will have 'Y'. While showing in dashboard we will list out meetings with recursive flag value as 'Y'.

Dashboard changes
Upcoming portlet changes
While displaying upcoming meetings based on the pagination size include dummy records(Data won't exists in meetings collection) for recursive meetings.
When we select dummy record, create a new record in meetings collection and allow user to schedule, delete and cancel the meeting.
While editing upcoming recursive meeting allow user to select current or all options.

When we select current option, we will update those details in the corresponding meeting collection. We don't allow user to change Till date value in this option.

When we select 'All' we will change recursiveMaxDays field in parent record as modified meeting date -1 and create new parent record with meeting date as modified meeting date +1, recursiveMaxDays value as previous parent record value and fkmeeting value as previous parent meetingid. We wont allow user to change meeting date.

While deleting dummy meeting, create new record in meeting collection and change the deletedflag value as "1".

Weekend flag
Added new field in meeting page to exclude recursive meeting creation on weekends. If this flag contains 'Y' then we will create meetings on Saturday and Sunday. This value will be updated in both parent and child records. While constructing dummy records we will refer value from parent record.

Recursive meeting scheduler changes
In meetings collection prevMeetingUTCDate field contains when the last recursive meeting was created. Based on the frequency value add number of days to prevMeetingUTCDate and check whether any meeting already exists for that day. If meeting doesnt exists then we will create new meeting on that day.
